

Building Intelligent AI Agents — Participant Setup

5-day hands-on workshop · labs run on each participant's own laptop · Trainer: Rajesh Gheware

In short: each participant needs a normal laptop with **Python** and **Jupyter**, a one-time software install (a single command we provide), and a few **free** accounts. No cost, no GPU, no cloud.

Each participant's laptop

- Windows, macOS or Linux · **8 GB+ RAM** · ~10 GB free disk space
- **Python 3.12** and **Jupyter** (or VS Code) installed
- A one-time install of the workshop's Python libraries — **a single copy-paste command the trainer provides**
- A **free AI model**: either install **Ollama** (runs on the laptop) **or** use a free **Groq** API key

Free accounts to create before the workshop

- **Groq** — the AI model service (*skip if using Ollama locally*)
- **Serper** — Google Search for the agents (Day 3)
- **Wolfram Alpha** — calculations for the agents (Day 3)

All three have **free tiers** — the trainer will guide participants through getting the keys.

For your IT team — please allow these websites

- `pypi.org` , `files.pythonhosted.org` — software install
- `api.groq.com` , `ollama.com` , `storage.googleapis.com` — AI model & data
- `google.serper.dev` , `api.wolframalpha.com` — Day-3 agent tools

Good to know: No GPU, no cloud, and **no paid subscription** required. The trainer provides all lab notebooks and a short setup walk-through at the start. A **detailed technical setup guide** is available for IT teams on request.
